

Error Log

In Exercises 2 and 6, I noticed that I had made a few errors in my code. For Exercise 6, the change generator for quarters, dimes, nickels, and pennies, the AI suggested that the amount should be below \$1.00, whereas I was expecting it to accept **any** amount of change. This required me to modify the code slightly.

I also had issues with my **package** and **public class** declarations, where I wrote the wrong package name while also giving my public class an incorrect name. This caused some confusion at first, but the mistake was quickly detected and corrected, resulting in the code working perfectly.
