

Credit name: CSE 2140 2nd Language Programming

Assignment name: Chapter 3 Mastery Reflection Log

Understanding The Problem:

AI was a huge beneficiary during this project it was extremely helpful and useful in helping me identify any mistakes or useless code inside my transcript it helped me learn lots of different simple codes which were very easy to understand and learn like int which is how the system stores all these options and / which is a division symbol and % which means the remainder variable it helped me identify and mistakes and helped simplify my codes to only the necessary code. At first I was very confused on where to begin. That's when I used AI and it started off with an int and then gave me the code to ask the user for the amount from there it got very simple and I was able to finish off my code.

Planning The Solution:

For me AI was very helpful for me when it came to planning my solution i decided to split my code into little parts and would use AI to get me started on my code and from there i had a step towards my destination and was able to actually finish my code without any difficulties i used AI to help guide me and from there it was very simple to finish off the code. AI was one of the tools i used for me exercises resulting in a very well functioning code

Implementation:

Personally, I wrote my code in small pieces using AI to help me find the right abbreviation terms to use. Through this I was able to find lots of success and learn lots of different coding terms to use for my code while also working at a slow and effectful pace. I tested my solution along the way by stopping after each part of the code and testing it. If the outcome from the computer was not what I was looking for then I would look and if I could not find out the problem then I would use AI to help me identify any mistakes in my code.

Overcoming Challenges:

For me i had the most difficulty in actually starting off my code you know trying to take that first step i needed somewhere to start so in order for me to overcome this i would use AI often for the beginning just to get an idea of what my starter should look like and from there onward it was very easy for me to finish up the code and get a fully functioning code.

Learning:

During this assignment I had learned a very valuable lesson and that is how to use AI properly not using it to do the work for you but rather using it as a search engine that helps you get an idea of what your code should look like not something too advanced but rather something that looks like what a grade 11 would code.
